< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Motto 1&2 instead of intro

Communication strategies

Diffusion strategy in some detail Adaptation and combination

Partially compatible knowledge

・ロット (雪) (日) (日)

Features of Bayesian setting

Open problems

Examples

Further reading

Motto 1: Bayesianism is natural

Bayesian modelling is principally very similar to our thinking

・ロ ・ ・ 一 ・ ・ 日 ・ ・ 日 ・

-

prior opinion & new observations \rightarrow posterior opinion

- opinion = knowledge = expectation = ...
- real life examples
 - learning to bike
 - learning to behave correctly
 - problem solving in maths
 - searching lost keys
 - even learning to cheat

Motto 2: Two heads are better than one

American Psychological Association: Two (or More) Heads Are Better Than One for Reasoning and Perceptual Decision-Making. (Dec. 18, 2014)

However, because accuracy is often correlated with confidence, it may be that the most confident group member exerts the strongest influence regardless of whether their answer is right or wrong, and it just so happens that the most confident person is usually right.

Lis posterior is the best?

(日) (日) (日) (日) (日) (日) (日)

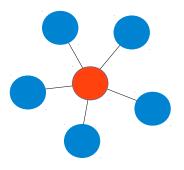

... but we're not that far (yet)

Fusion center

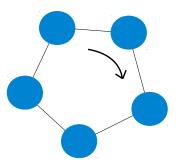

- oriented graph (tree)
- nodes gather observations
- FC responsible for info processing
- ... and may send results back
- + effective information processing
- + node malfunction can be detected
- + relatively flexible (node addition/removal)
- + simple COMM protocol
- SPoF at FC
- high COMM requirements at FC

・ コ ト ・ 雪 ト ・ 目 ト ・

Incremental strategy

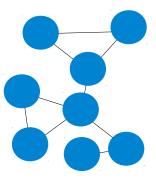

- oriented graph Hamiltonian cycle
- nodes are equivalent
- + easy information processing
- + simple COMM protocol
- SPoF at each node (recovery is NP hard)
- info poisoning propagates further

・ロット (雪) ・ (日) ・ (日)

Consensus and diffusion

- more complex graph with higher node degrees
- no dedicated nodes, no FC
- COMM among neighbors within 1 edge distance
- + COMM requirements relatively OK
- + excellent redundancy (no SPoF)
- + excellent flexibility (node addition/removal)
- + node malfunctions (poisoning) detectable
- more complicated info processing

・ ロ ト ・ 雪 ト ・ 雪 ト ・ 日 ト

Consensus

- multiple time scales
- → sensing step
- → information processing step
- → consensus iterations
 - higher COMM reqs.
 - higher processing reqs.
- + consensus reached

Diffusion

- single time scale
- → adaptation step
- → combination step
 - + lower COMM reqs.
 - + lower processing reqs.
 - no consensus

Diffusion strategy

1. Adaptation step: observations are shared and incorporated into local knowledge.

Bayesian	update	@	node
----------	--------	---	------

prior opinion & **new observations** \rightarrow posterior opinion

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

2. *Combination step:* posterior opinions are shared among neighbors.

Information fusion @ node

several posterior opinions \rightarrow one opinion

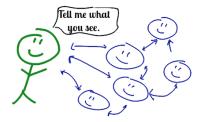

Diffusion strategy

 Adaptation step: observations are shared and incorporated into local knowledge.

Bayesian update @ node

prior opinion & **new observations** \rightarrow posterior opinion

 $p(\theta | \text{observations}) \propto \mathcal{M}(\text{observations} | \theta) \times p(\theta)$

(ロ) (同) (三) (三) (三) (○) (○)

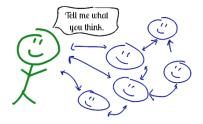

Diffusion strategy

Combination step: posterior opinions are shared among neighbors.

Information fusion @ node

several posterior opinions \rightarrow one opinion

 $\tilde{p}(\theta|\cdot) = \bigoplus_{i} p_i(\theta|\text{observations})$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

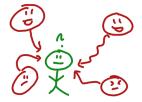

Diffusion strategy – possible settings

Two possible protocols:

- ATC Adapt–then–Combine
- CTA Combine–then–Adapt
- + isolated A and C

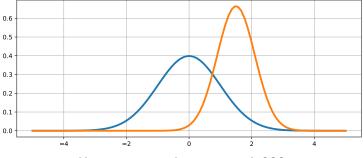

Information weighting

- Equality of neighboring nodes
- Discrimination and preferences of nodes

・ ロ ト ・ 雪 ト ・ 雪 ト ・ 日 ト

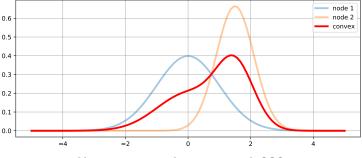

Assume that we have two (prior, posterior...) opinions:

How to merge them correctly???

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

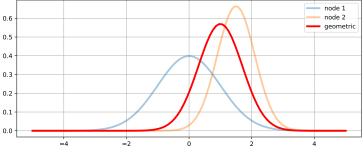

Assume that we have two (prior, posterior...) opinions:

How to merge them correctly???

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Assume that we have two (prior, posterior...) opinions:

How to merge them correctly???

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

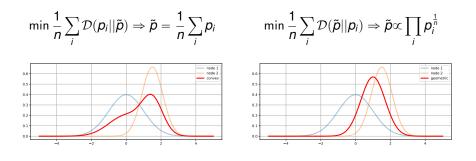

Kullback-Leibler divergence

Assume 2 pdfs p, q s.t. $q(x) \ll p(x)$. Then

$$\mathcal{D}(p||q) = \mathbb{E}_{p(x)} \left[\log \frac{p(x)}{q(x)} \right] dx = \int p(x) \log \frac{p(x)}{q(x)} dx$$

 $\mathcal D$ is a premetric (nonnegative, asymmetric, does not fulfill \bigtriangleup inequality).

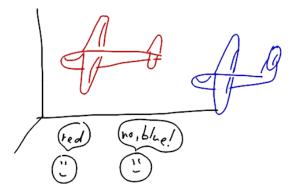

Criterion to find the best approximating \tilde{p} :

・ロン ・四 と ・ ヨ と ・ ヨ と

Partially compatible knowledge

How to detect that our nodes refer about the same process?

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Partially compatible knowledge

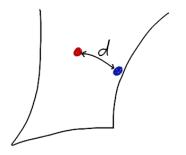

How to detect that our nodes refer about the same process?

Measure dissimilarity

- distance (Euclidean)
- divergence (prob. manifold)

Common parameters?

- factorize posteriors (VB)
- marginalize (submodels in KF)

・ ロ ト ・ 雪 ト ・ 目 ト ・

Features of Bayesian setting

- + Excellent explainability
- + Natural interpretation, works similarly to human thinking
- + "Absolute" generality: no special assumptions or concrete models

・ロット (雪) (日) (日)

- + Many existing solutions are only special cases
- Perceived as "too complex/complicated"
- Single-problem-oriented solutions may be superior

Open problems

- Combination of predictions
- Partially compatible models
- ...and submodels
- ... and models of (generally) correlated processes

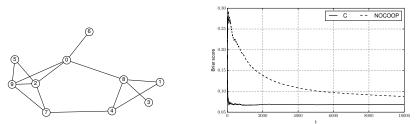

・ コット (雪) (小田) (コット 日)

- Information weighting
- etc.

Example: Logistic regression

Bhatt and Dhall's skin-nonskin dataset:

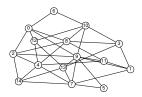

- classes: skin, non-skin
- regressors: [1, B, G, R]
- 10,000 observations
- sequential classification & learning

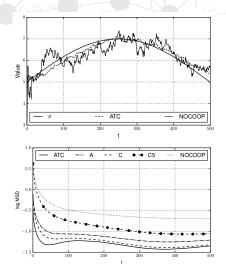

Example: Poisson process rate estimation

Simulated data, TV parameter:

- observations: Poisson variable
- 500 observations
- sequential estimation of time-varying rate

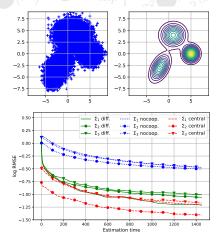

・ロト・日本・日本・日本・日本・今日~

Example: Mixture estimation

Simulated data:

- observations from mix
- 1500 observations
- sequential estimation
- floating window: 50 obs.

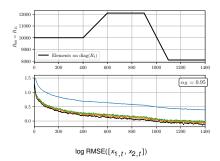

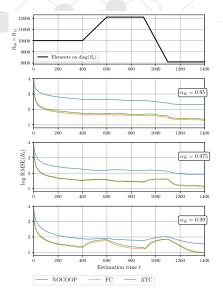

Example: VBKF w/ unknown noise covs.

Simulated data:

- 2D trajectories, CVM
- sequential estimation
- est. of states and TV MNCM
